SUBJECT: Automated Efficiency Tracking Tool for Fuel Depots

Purpose of This Memo

The operations team currently reviews site performance manually, which is time-consuming and prone to delays. I have built a simple, automated tool that calculates efficiency instantly for our three fuel depots and flags any site that needs attention. This memo explains what the tool does, why it matters, and how we can use it going forward.

What I Built

I created a small program that:

Calculates a performance score for each site.

This score is the efficiency percentage – it compares how much fuel a depot actually delivered against what it was supposed to deliver.

For example, if a depot was supposed to deliver 10,000 litres but delivered only 8,200, the score is 82%.

Assigns a health status to each site.

Below 70% → "Critical" – needs immediate attention.

70% to 89% → "Warning" – underperforming and should be reviewed.

90% or above → "Normal" – operating as expected.

Automatically generates a one-page report that lists every site, its numbers, its efficiency score, and its status.

This report is clear, consistent, and ready to be shared with the team in seconds.

Why This Matters

Currently, tracking efficiency involves pulling numbers from different spreadsheets, calculating percentages by hand, and then deciding if a site is doing well. This process can take hours and often gets delayed until the end of the month.

With this tool:

The report is ready instantly the moment we enter the latest delivery numbers.

We no longer rely on manual math, which eliminates human calculation errors.

We can run the report daily, weekly, or whenever we want – without extra work.

How This Helps Us Identify Problems Faster

Instead of waiting for a monthly review to discover that a site missed its target, this tool can be run every day or every week. The instant we enter the numbers:

Critical sites appear immediately – we can investigate them on the same day.

Warning sites show us a trend before they become critical.

Normal sites confirm they are on track, so we can focus our attention elsewhere.

This is like having a traffic light system for our depots – green means keep going, yellow means watch closely, red means stop and fix. Managers can see the whole picture in a few seconds, not a few hours.

Recommended Next Steps

I suggest we start using this tool in three simple phases:

- Test phase (next 2 weeks)
- Run the tool alongside our existing manual process. Compare the results to confirm accuracy.
- Transition phase (following 2 weeks)
- Replace the manual calculations with this automated report for all three depots.
- The site managers can receive the report every Monday morning to guide their weekly planning.
- Expansion phase (next quarter)

Add more depots or other sites (retail stores, warehouses, etc.) to the tool.

The program is built in a way that makes adding new sites very easy – just list their name and target numbers, and the report updates automatically.

Conclusion

This tool turns a time-consuming, manual task into an automatic, instant check-up for our fuel depots. It lets us spot problems early, focus our attention where it matters, and make better decisions faster. I am ready to walk the team through using it and to adapt it to any feedback you have.
